Final QA Report: Restful Booker Platform (Shady Meadows B&B)

Prepared by: Haifa Samir | Application: https://automationintesting.online/ | Test period: 7 days

1. Executive Summary

Recommendation: NO-GO.

Sixty test cases were designed and run through the user interface. 39 passed, 19 failed and 2 were blocked. The normal booking path works: a guest can reserve a room with valid details, and prices, names, phone and email limits behave as expected. However, the date handling inside the booking flow fails. Reversed dates and past dates are accepted, a negative total is shown, and overlapping bookings are recorded as accepted. These are High-severity defects in the part of the system that earns the hotel's revenue, and none has been fixed. In addition, automated security runs reported that guest enquiries can be read without signing in; this must be confirmed manually, and if it is confirmed it is a Critical defect that independently blocks release.

2. Scope and Approach

- **In scope:** room browsing, the booking workflow and form validation, the contact form, administrative functions, and navigation, all tested through the user interface on the live site.
- **Out of scope:** API testing (excluded by decision of the tester), performance and load testing, penetration testing, and cross-browser testing beyond the primary browser.
- **Method:** risk-based test design (positive, negative, boundary and exploratory cases), manual execution with evidence, and automated UI regression with Playwright for selected scenarios.
- **Reference documents:** Test Strategy, Test Cases and Execution Results (Test_Cases_Execution.xlsx), and the Bug Report.

3. Coverage

3.1 By module

Module	Cases	Pass	Fail	Blocked
Booking	32	18	12	2
Contact	8	7	1	0
Admin	14	10	4	0
Navigation	3	1	2	0
Exploratory	3	3	0	0
Total	**60**	**39**	**19**	**2**

3.2 By priority

Priority	Cases	Pass	Fail	Blocked
High	29	21	7	1
Medium	21	14	6	1
Low	10	4	6	0

3.3 What is covered

Booking form validation (names, email, phone, trimming), booking dates and price calculation, the contact form (validation, double submit, owner reading messages), admin sign-in and sign-out, room management, the bookings report, navigation links, and exploratory checks (special characters, responsive layout, refresh).

3.4 What is not covered

API behaviour, performance, accessibility, the room amenities and "Accessible" flag, and the location map and contact details.

4. Execution Outcomes

Status	Count	Share
PASS	39	65.0%
FAIL	19	31.7%
BLOCKED	2	3.3%
NOT RUN	0	0.0%
Total	**60**	**100%**

- Executed (pass or fail): 58 of 60 (96.7%).
- Pass rate of executed cases: 39 of 58 (67.2%).
- High-priority cases executed: 28 of 29 (96.6%).

5. Major Observations

5.1 What works

- A normal booking with valid details is accepted , and dates, nights and totals are calculated correctly.
- Name and phone length limits and invalid email formats are enforced
- Admin sign-in, wrong-login rejection and sign-out work
- A new price set by the owner reaches guests at once , and bookings and messages reach the admin area .

5.2 Failures

Severity	Finding	Test cases
High	Check-out before check-in is accepted; rooms are offered and the total is negative	TC-016, TC-034, TC-035
High	Past dates are accepted in the availability search	TC-017
High	Overlapping booking on the same room recorded as accepted (video evidence pending)	TC-018, TC-039

Severity	Finding	Test cases
Medium	Duplicate room number is accepted	TC-048
Medium	Double-click on Create adds the room twice	TC-047
Medium	Double-click on contact Submit sends two messages	TC-042
Medium	Letters accepted as a phone number (booking and contact forms)	TC-013, TC-043
Medium	Branding cannot be saved, even with no changes	TC-051
Low	Names are not trimmed of leading and trailing spaces	TC-015, TC-058, TC-059
Low	Booking calendar opens on the wrong month; confirmation shows no reference or total	TC-037, TC-038
Low	Missing-field error for room creation is not specific	TC-049
Low	The Amenities link goes nowhere; footer Quick Links jump to the top	TC-055, TC-056

6. Unresolved Risks

- **The API is untested.** Validation, authorization and status-code defects at service level may exist undetected, and the guest-data exposure above is exactly the kind of issue API testing would examine.
- **Shared demo environment.** Bookings and messages reset every few minutes, so results reflect the tested period only and booking persistence was not proven on a private copy.
- **Evidence gaps.** Several failed and passed cases still lack screenshots or video; defects are only confirmed once reproduced with evidence.
- **Not assessed:** amenities and accessibility flag, performance under load, accessibility, wider browser coverage.

7. Release Recommendation

NO-GO.

Reasoning, against the release criteria in the Test Strategy:

1. The booking flow fails on date handling. Reversed, past and overlapping dates are accepted, and a negative total is shown. Seven High-priority cases fail, so the criterion of no open High defects is not met.
2. If the guest-data exposure is confirmed, it is a Critical defect, and any open Critical defect means NO-GO by itself.
3. The remaining defects (duplicate and double-click handling, input validation, Branding) are Medium or Low and would be acceptable as a conditional release once the items above are fixed.

Conditions to move to CONDITIONAL GO

- Reject reversed, past and overlapping dates with a clear message, and never show a negative total.
- Confirm the guest-data exposure manually; if present, restrict guest messages to the signed-in owner.
- Re-test the new-room visibility and re-run all failed cases with evidence.
- Record every confirmed defect with steps, severity and screenshots, then review this decision.
