Test Strategy: Restful Booker Platform (Shady Meadows B&B)

Prepared by: Haifa Samir | Application: https://automationintesting.online/ | Version 1.0

1. Scope

In scope (tested through the user interface):

- **Guests:** browsing rooms, checking availability, booking a room, the price shown, the contact form, and navigation and footer links.
- **Owner area:** signing in and out, adding, editing and deleting rooms and prices, reading messages, the bookings report, and Branding.
- **End to end:** a guest's booking or message reaches the owner, and a price set by the owner is the price guests see.

Out of scope:

- API testing
- Performance and load testing, penetration testing, and cross-browser testing beyond the primary browser.
- Email delivery and links that leave the site.

2. Assumptions

- The site is a public, shared demo that other people use at the same time. Its bookings and messages reset every few minutes, so lists can change while a test runs.
- Test runs create real bookings, rooms and messages on the site, so test data uses identifiable names (for example "QA Test + date").
- Guests do not sign in. Owner credentials come from the project's public documentation and are not stored in the repository.
- No requirements document exists. Validation rules are taken from the messages the application shows and from the source repository.

3. Risks

1. A guest makes a mistake while booking and gets a crash, a negative price or a lost booking instead of a clear message.
2. Invalid dates are accepted, including reversed, past and overlapping ones.
3. Guest personal details are exposed to people who are not signed in.
4. A price the owner sets differs from what guests see or pay.
5. Double-clicks create duplicate rooms, messages or bookings.
6. Wrong contact details (for example a phone number made of letters) leave the owner unable to reach a guest.
7. Because the API is not tested, service-level defects may go undetected.
8. The shared environment resets, so a single result can be unreliable.

4. Priorities

Priority	Areas	Reason
High	Booking flow (dates, validation, price), admin sign-in and access control, price consistency, bookings reaching the owner	Revenue and guest data
Medium	Room management, contact form, messages, Branding	Operations and communication
Low	Navigation and footer links, responsive layout, exploratory checks	Polish, no business blocker

5. Test Environment

Item	Details
Application	https://automationintesting.online/ (shared demo, recorded as Production)
Test period	7 days
OS and browser	chrome

Item	Details
Execution approach	Important cases are repeated at least twice because of resets and other users
Test data	Self-created records with identifiable names

6. Exit Criteria

- 100% of High-priority cases are executed, and at least 90% of all cases.
- Every NOT RUN or BLOCKED case has a documented reason.
- Every failure is reproduced and documented with evidence.
- No Critical or High defect remains open, or each remaining one is listed in the final report with its release impact.
- At least 5 regression scenarios are automated and executed.
- The final QA report with a release recommendation (GO, CONDITIONAL GO or NO-GO) is completed.
